GENERAL NOTES

- Resistance values in ohms, 1/4 watt, $\pm 5\%$, unless otherwise noted. K = 1,000, M = 1,000,000
- Capacitance value of 1 or less is in microFarads, above 1 in picoFarads, unless otherwise noted.
- * Q900 and Q906 are not in High-Voltage PCB.
- All D.C. voltages are $\pm 10\%$ measured from point indicated to ground, using a high-impedance meter. Voltages are measured with no signal input and controls are in a normal operating position.
- Circled numbers indicate location of waveform reading.
- ZD100-101 uses (66X0040-007) zener diode in series with (340X2331-934) 330-ohm resistor in early production models.
- Use a 1,000:1 probe when measuring G2 (screen) or focus voltage.

⚠ WARNING ⚠

Components identified by shading have special characteristics important to safety and should be replaced only with identical types.

C. Address Decoder

CAUTION

While testing decoders and ROMs, it may be necessary to add 270 pF capacitors to ADDR 12, 13, 14 and 15 to eliminate unstable signatures.

1. CAT Box Settings for Address Decoder Test

Probe	Trigger	IC-Pin	Test Pt.
Start		R2-12	
Stop		R2-12	
Clock			Φ2

2. Signatures

Verify CAT Box settings and connections as follows:

- probe GND test point = 0000 signature
- probe +5V test point = 0001 signature

Logic Probe on IC-Pin	Logic Probe on Test Pt.	Signal Name	Signature Should Be
R2-2			7631
R2-1			383A
R3-6			4P0A
R2-4			04UH
R2-3			160U

		ROM0	CFHH
		ROM1	57HH
		ROM2	96F8
		ROM3	546U
		ROM4	755P
H3-10		ROM	5FU9

Jumper R/W test point to +5V test point.

Logic Probe on IC-Pin	Signal Name	Signature Should Be
K6-12	SINP1	U14U
K6-11	SINP2	HF1A
K6-10	EAROMRD	U0HA

P3-3		587H
P3-4		5AAC
P3-5	IO0	C787
P3-6	IO1	9UAP
R3-11	IOS	2828

Remove jumper between R/W test point and +5V test point.

NOTE

If you are taking signatures on a PCB connected to a game, disconnect the connector to the coin counter(s). The coin counter will energize while K4-6 is connected to ground.

Jumper WRITE, K4-6, to GND test point.

D. ROM and Data Lines

We are providing only the signatures for ROM4. This ROM contains the self-test procedure that tests all the other ROMs and displays a number representing a ROM failure.

NOTE

When taking signatures of ROM4, install 270 pF capacitors between IC R2, pin 12 and ground and IC R2, pin 14 and ground.

1. CAT Box Settings for ROM4 Test (I.C. J1 for ROM part no. 136006-201)

Probe	Trigger	Test Pt.

- probe GND test point = 0000 signature
- probe +5V test point = 755U signature

Watchdog

The Watchdog circuit will send continuous reset pulses to the microprocessor if a problem exists within the microprocessor circuit. If the self-test fails to run, it is a good practice to check the reset line.

RESET is a microprocessor input (pin 40). In a properly operating game, reset should occur during power-up or when the reset pushbutton is activated. A pulsing RESET line indicates that something is causing the microprocessor to lose its place within its program. Typical causes are:

1. Open or shorted address or data bus lines
2. Bad microprocessor chip
3. Bad bus buffers
4. Bad ROM
5. Bad RAM
6. Any bad input or output that causes an address or data line to be held in a constant high or low state

A pulsing RESET signal indicates a problem exists somewhere within the microprocessor circuitry rather than within the Analog Vector-Generator.
